Styles live in custom-css.css

The frontmatter names a stylesheet next to the deck instead of holding the CSS inline, so the markdown stays about the slides.

> Edit `custom-css.css` while `colloquium serve` runs and the deck rebuilds.

The built HTML is still one file

The file’s contents are inlined at build time, so PDF export, share images, and hosting work exactly as before.

- Relative paths resolve next to the markdown file
- Inline CSS in `custom_css` keeps working
- A missing file is a build error that names the path
